zOS Version: z/OS V2.3 in October 2015. This release of . The present invention relates to acoustic transducers and methods for controlling their characteristics. In particular, the invention relates to ultrasonic transducers made for use in liquid, and methods for their control. Ultrasonic transducers are used in many industries, particularly the food industry. For example, they are used for a variety of processing applications, including measuring fat content, ripening, freezing and thawing, and densifying. These transducers are used in both stationary and mobile applications. In a typical operation, an ultrasonic transducer is either immersed in the item being measured, or a carrier is immersed in the item. The transducer is excited by a source which generates an electrical signal with a frequency chosen to cause an acoustic wave to propagate into the item, causing a pressure change that is measured as an electrical signal by the transducer. In other words, the electrical signal is converted into an acoustic wave and then into an electrical signal. The electrical signal is a function of the pressure in the item, and thus is representative of the item's state. One problem with current transducers is their lack of operational stability. Often, the performance of the transducer drops off sharply after the transducer has been in operation for several hours. The transducer's ability to respond predictably to fluctuations in ambient temperature or to changes in the item being measured is also adversely affected. Another problem associated with some prior art transducers is their failure to capture the desirable characteristics of a ring transducer. In particular, acoustic wave coupling is poor in ring transducers. Also, the prior art ring transducers suffer from an offset temperature drift. An object of the present invention is to provide a method for maintaining the operation and performance of acoustic transducers over the life of the transducer. A related object is to provide a method for maintaining the operational and performance characteristics of a ring transducer. Another object is to provide an acoustic transducer that is capable of precise temperature control. A related object is to provide a method for maintaining the operational and performance characteristics of an acoustic ring transducer over a period of several days. The present invention provides a method for operating a transducer for long periods of time. The method uses resonant feedback to maintain the operation of the trans 6d1f23a050
